Campus Buddy KICT

The app we build together in class, week by week — CSCI 4311 Mobile Application Development (IIUM, KICT).

Never used git before? You only need 4 commands for this whole course, and every one of them is written out below. Just copy, paste, press Enter.

CHECK: Before you start — checklist (once, before week 1)

- [ ] **GitHub account** — sign up at https://github.com/signup (free). Remember your username and password — you'll need them to submit work.
- [ ] **Git installed** — open a terminal and type `git --version`. If you see a version number, you're done. If you see "command not found", install Git from https://git-scm.com/downloads
- [ ] **Flutter installed** — `flutter doctor` runs and mostly shows OK (we set this up together in lab 1)
- [ ] **An emulator or a phone** that `flutter run` can install to

Step 1 — Clone this repo (once, at the start of the course)

1. Open a terminal: - **Windows:** Start menu -> type **Git Bash** -> Enter - **Mac:** Terminal
2. Type this (or copy-paste it), then press **Enter**:

`` `git clone https://github.com/AhammadAliPK/campus_buddy_kict.git` ``

3. Move into the folder you just downloaded:

`` `cd campus_buddy_kict` ``

CHECK: Type `ls` and press Enter — you should see `pubspec.yaml`, `lib`, `android`, `ios`.

Step 2 — Switch to YOUR section's branch (once)

Everyone gets the same app, but each class has its own branch.

If you are in Section 1:

```
git checkout section1
```

If you are in Section 2:

```
git checkout section2
```

CHECK: You should see `Switched to branch 'section1'` (or `'section2'`).

TIP: You only do this once. After today, `git pull` (below) is all you need.

Step 3 — Run the app

1. Download the packages the app needs:

`` `flutter pub get` ``

2. Start your emulator, or plug in your phone, then:

`` `flutter run` ``

CHECK: The app opens on your device. **TIP:** The very first build takes a few minutes — that's normal, not broken.

Every week — get the latest code we built in class

```
git pull
flutter pub get
flutter run
```

CHECK: After `git pull` you should see `Already up to date.` or a list of changed files.

Even if you couldn't finish the lab yourself, `git pull` gives you the working version from class — study it, run it, learn from it.

TIP: If `git pull` shows an error (especially one mentioning "conflict"), stop and bring your laptop to class or lab — don't guess.

Assignments — create YOUR branch

Branch naming convention (we check your work from this branch):

```
section<N>/week<M>/<matric-no>
```

- `N` = your section (1 or 2)
- `M` = the teaching week the assignment was given (assignments start in week 3) — same number as the `week-0M` tag
- `matric-no` = your matric number, e.g. `G251000`

Examples:

You are…	Assignment given in	Matric no.	Your branch name
Section 1	week 3	G251000	`section1/week3/G251000`
Section 2	week 4	G251001	`section2/week4/G251001`

Steps — example below is Section 1, week 3's assignment, matric G251000. Replace with **your** section, week, and matric:

1. Create your branch from the week tag given in the assignment sheet (same number as the week — week 3's assignment -> tag `week-03`):

`` `git checkout -b section1/week3/G251000 week-03` ``

2. Build the assignment. **Commit as you go** — many small commits are better than one big one:

`` `git add -A git commit -m "week3: added schedule screen"` ``

3. Submit = push your branch to GitHub:

`` `git push -u origin section1/week3/G251000` ``

TIP: **The first time you ever push**, a browser window opens and asks you to sign in to GitHub. That's normal — sign in, click **Authorize**, and the push continues. It only happens once.

4. Made more changes after pushing? Commit and push again (no `-u`):

`` `git add -A git commit -m "week3: fixed layout" git push` ``

CHECK: Check it worked: open the repo on GitHub (https://github.com/AhammadAliPK/campus_buddy_kict) -> click the dropdown that says `main` -> type your branch name -> your code is there. That's your submission.

Rules

- **Never** push to `main`, `section1`, or `section2` — those are the lecturer's branches (GitHub will block you anyway).
- Only push branches named `section<N>/week<M>/<matric-no>`.

Troubleshooting

You see	What it means	Fix
`git: command not found`	Git isn't installed	Install from git-scm.com/downloads, then **close and reopen** the terminal
`flutter: command not found`	Flutter not on PATH	Redo the lab-1 setup, then reopen the terminal
`fatal: Repository not found`	Typo in the URL	Copy-paste the exact clone command above
Browser window on first push	Git asking who you are	Sign in to GitHub -> Authorize. Once only
`git pull` error / "conflict"	Your local files touched the same lines	Stop. Ask in class or lab
`flutter run` says no devices	Emulator/phone not connected	Start the emulator first (Android Studio -> Device Manager)

Flutter version used in class

```
Flutter 3.47.6 • channel stable
Dart 3.13.5
```

If something behaves strangely, run `flutter --version` and compare.
